The active enzyme catalyzes the transfer of acyl groups from lecithin to sterol to form sterol esters. Palmitcyl, oleoyl, and linoleoyl residues can be transferred; a number of sterols, including cholesterol, can act as acceptor. Apolipoprotein A-I is a potent activator for this enzyme.

[FICATION #superfamily phosphatidylcholine--sterol avyltransferase]

Mean 29.422; Variance 127.873; scale 0.230 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                              residue insertion between cysteines 4 and 5 instead of the usual single residue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Asn hydroxylation. The 7th repeat contains the consensus O-glycosylation sequence, CXCXPC.

Immediately following ach repeat is a pentapeptide with the consensus sequence XD(IV)(D/N)E. Fibulin binds to the cytopasant change the betal subunit of integrin adhesion creceptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, with the protein have important diagnostic and therapeutic uses. See also RI1147, RI1148 and RI1150.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
the repeat lacking two Cys residues. The same motif is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The disulphide-stabilized loop structure is thought to be conserved. The type II motif, related to repeats found in epidermal growth the nith repeat in the A form is incomplete. Four of the repeats in the nith repeat in the A form is incomplete. Four of the repeats, 2, 4 and 9) differ from the EGF-like motif in having a 4-6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;

```
Purified fibulin, DNA encoding it and antibodies reactive with it useful as diagnostic and therapeutic component.

Useful as diagnostic and therapeutic component.

Claim 10, Fig 5: 56pp; English.

The fibulin A, B and C forms are identical from their N-terminals to a divergence point at posn. 566 (terminal codon in fibulin A) and stainct, encoding polypeptides of 566, 601 and analysis with on and spacing of the Cys residues revealed two cys repeat lacking two Cys residues. The same motif is found in repeat lacking two Cys residues. The same motif is found in the repeat lacking two Cys residues. The same motif is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The components C3a, C4a and C5s; the inverse is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The disulphide-stabilized loop structure is thought to be conserved. The type II motif related to repeats found in epidermal growth factor precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats.

(2, 3, 4 and 9) differ from the EGF-like motif in having a 4-6 consensus sequence for Asp and Asn hydroxylation. The 7th repeat consensus sequence for Asp and Asn hydroxylation. The 7th repeat consensus sequence XD(I/V)(D/N)E. Fibulin binds to the cytoplasmic domain of the betal subunit of integrin adhesion receptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, with the contains the consensus sequence in a cation-dependent, EDTA-reversible manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  laminin, and possibly also other proteins. Antibodies reactive with the protein have important diagnostic and therapeutic uses See also R11147, R11148 and R11149.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ur 4

Tryptophan aporepressor used in vaccine prodn., etc. - contains
Within its' amino acid sequence, a peptide segment heterologous
to the aporepressor located on aq. solvent-assessible surface
Claim 4 + 20; Page 68 + 72; 82pp; English.

The hybrid protein contg. receptor binding sites is active as ligand
for mammallan cell receptors and can be used for a variety of
applications including treatment of diseases resulting from receptor/
ligand dysfunction, and in vaccine prodn.
                                                          The monoding 4-1BB ligand polypeptide(s) - useful for stimulating T-cell proliferation in vitro, and as research tools
This protein comprises human 4-1BB ligand (4-1BB-L), a novel
C-cytokine capable of binding cell surface receptor 4-1BB (see
C-comprise). Its amino acid sequence was deduced from an isolated
C-comprise and acid sequence was deduced from an isolated
C-comprise and also been identified (see W26656). Human
4-1BB-L polypeptides, especially claimed soluble polypeptides
C-comprising the 4-1BB-L extracellular domain (amino acids 49-254),
can be expressed in transformed host cells. They can be used to
stimulate T-cell proliferation in vitro, as research tools and as
immunostimulants for purifying 4-1BB. They may also be useful as
sequence 254 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        36 lpllnlmltpderealgtrvriveecsrrgdmscsgrelknelgagiatitrgsnslkaa 95

Claim 3; Page 12-14; 20pp; Japanese.
This protein is a porcine complement inhibitor encoded by pMCPCDNA (TRIO99). The DNA is useful for large scale production of the forcembinant porcine complement inhibitor, which is useful for porcine organ transplantation into humans. The DNA clone pMCPcDNA is also useful in the analysis of the promoter region of porcine complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

DNA encoding porcine complement inhibitor - useful in porcine organ
                                                                                                                                                                                                                                                                                                                                                The protein sequence of hPES was deduced from the cDNA sequence obth. by screening a human genomic library in EMBL3. hPES can be used to screen anti-inflammatory agents. An anti-body against a peptide specific to hPES can be made, and used for the determination of the protein. Sequence 599 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä

Programmed cell death may be treated through the use of the HSV-1
gene gammal 34.5 or prod. of its expression, ICP34.5. The gene and
its expression have been demonstrated to be required for HSV-1
neurovirulence, and in partic., to act as an inhibitor of neuronal
programmed cell death which allows for viral replication. Use of
the gene therapy, or the protein itself, can be expected to result
in inhibition of programmed cell death in various neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Use of gamma, 34.5 gene or encoded ICP 34.5 - for preventing or
treating programmed cell death in neuronal cells or in screening
                                                                                                                                                                                                                                                     New glutamic acid receptor and gene - for use in analysis of synaptic signal translation, and diagnosis of brain disease claim 1; Page 25-31; 35pp; Japanese.

The sequence shows a glutamic acid receptor. The receptor is useful for the analysis of nerve signal translation; within the synapse, expression of synapse plasticity, nerve cell necrosis, pain structure and brain disease. It can also be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene therapy;

Statistics: Mean 21.806; Variance 86.670; scale 0.252

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The promoter's transcription can be regulated by proteins encoded by the production of proteins for drug or food use. The promoter's culture in a complete nutritive medium.
                                                                                   Disclosure; Page 77-84; 110pp; English.
Saccharomyces cerevisiae DKD5D, which is sensitive to aureobasidin, was mutagenized with EMS and genomic libraries of 2 resistant strains were prepared. Resistant gene scauriR (Q75956) from the other. A DNA fragment of scauri was used as a probe to isolate a sensitive gene, scauris (Q75956), from the other. T852A mutation leading to a F158Y conversion gave rise to the resistance 1477 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Saccharomyces cerevisiae aureobasidin resistance protien scaur2.

Edysteroid dependent regulation of genes in mammalian cells -
for induced expression of heterologous genes
Disclosure; Fig 1; 45pp; English.
This sequence represents an eddysteroid receptor DHR23alpha. DHR23-
alpha is a Drosophila steroid receptor homologue which can function as
alpha is a Drosophila steroid receptor homologue which can function as
alpha is induced upon administration of certain ecdysteroids but not
alpha is induced upon administration of certain ecdysteroids but not
any of the mammalian hormones tested. DHR23alpha has been reported to
regulate transcription of genes containing ecdysone response elements
in Drosophila tissue culture cells treated with 20-0H ecdysone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                          DNA encoding insect steroid receptors - and ligands, for use as benign inducing factors
Claim 24; Page 103; 126pp; English.

The amino acid sequence codes for the (20-OH) ecdysone receptor protein which is part of the insect steroid receptor superfamily. It can be used to screen for ligands specific for the insect steroid receptors which can be used as highly specific and highly active pesticides which are biodegradable. See also Ri3791-Ri3794.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ecdysteroid, receptor; DHR23alpha; Drosophila; steroid; receptor;

                                                                                                                                                                                                                                                    Pulmonary surfactant proteins - used for treating Hyaline Membrane Disease or Respiratory Distress Syndrome.
Claim 1; Page 33-34, 50pp; English.
Gene product may be used in treatment of Hyaline Membrane Disease and Respiratory Distress Syndrome (RDS) in both premature infants and adults eg. cardio-pulmonary operations. The protein products may also be used to raise diagnostic antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pulmonary surfactant proteins - used for treating Hyaline Membrane Disease or Respiratory Distress Syndrome. Genomic sequence of human alveolar surfactant protein (hASP)
encoded by genomic DNA, used to obtain pASPcg-SV(10)
Regulatable expression system.
Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example: Fig 5; 94pp; English.
A regulatable expression system for a coding sequence is the system can process genomic as well as intronless DNA.
Sequence 248 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example; Fig 6; 94pp; English.

DNA encoding porcine complement inhibitor - useful in porcine organ transplant to humans
Claim 3; Page 12-14; 20pp; Japanese.
This protein is a porcine complement inhibitor encoded by pMCPcDNA (761098). The DNA is useful for large scale production of recombinant porcine complement inhibitor, which is useful for porcine organ transplantation into humans. The DNA clone pMCPcDNA is also useful in the analysis of the promoter region of porcine complement inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

New agouti signal protein peptide(s) and nucleic acids - used for altering melanin prodn., for treating e.g. melasma photo-ageing spots, solar keratosis or vitiligo.

Taltering melanin prodn., for treating e.g. melasma photo-ageing spots, solar keratosis or vitiligo.

The sequences given in W10101-29 are biologically active peptides.

The sequences given in W10101-29 are useful for cosmetic purposes and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for cilinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some forms of albinism and hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18-529-1997 (first entry)

Human agout1 signalling protein fragment #2.

Agout1 signalling protein; ASP; depigmenting activity; cosmetic;

hyperpigmentary condition; melasma photoageing spots; solar keratosis;

post-inflammatory hyperpigmentation; wound healing; eumelanogenesis;

vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                DNA corresp. to (part of) foot and mouth disease virus RNA - useful in prepn. of vaccines for producing antibodies against the virus Example; Fig 6; 57pp; English.
The inventors claim a DNA molecule comprising a nucleotide sequence corresp. to all or a portion of foot-and-mouth disease virus RNA (FMDV). The DNA molecule is esp. for a precursor of FMDV capsid protein. It esp. codes for FMDV protein p88 and VPI-VP4. It may code for VH4, VP2, VP3 and VPI contiguously. The inventors also claim a vaccine for stiumlating prodn. of antibodies against FMDV in a mammal which comprises at least one of the above recombinant proteins produced by a host cell transformed with the DNA.

A deficiency of the enzyme results in galactosaemia. The amino acid sequence of UDP-G4E was deduced from a CDNA clone (T58301) derived from a human endometrial tumour library. Recombinant UDP-G4E polypeptides can be produced in transformed host (e.g. E. coli, COS, Sf9 insect) cells or expressed in vivo for use in the treatment of UDP-G4E deficiency, e.g.

Bacillus thuringlensis toxin gene - useful in recombinant hosts, particularly plants for the control of nematodes Claim 4; Page 35-39; 44pp; English.

This sequence represents the protein encoded by a polynucleotide of the invention. The polynucleotide of the invention is a sequence from a Bacillus thuringlensis (Bt) isolate selected from PS80JJ1, PS158D5, PS169E, PS177F1, PS177G, PS204G4 and PS204G6, that encodes a toxin active against nematodes. This sequence represents the 167P protein, and is a delta-endotoxin protein. The polynucleotides and toxins can be used for the control of nematode pests such as Panagrellus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New agout 1 signal protein peptide(s) and nucleic acids - used for altering melanin prodn., for treating e.g. melasma photo-ageing spots, solar keratosis or vitiligo claim 5; page 8-9; 67pp; English.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signaling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some
           Agouti signalling protein; ASP; depigmenting activity; cosmetic; hyperpigmentary condition; melasma photroageing spots; solar Keratosis; post-inflammatory hyperpigmentation; wound healing; eumelanogenesis; vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M.7.APR.1998 (first entry)

The sequences given in W10101-29 are biologically active peptides and fragments of the agout1 signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperplamentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperplamentation such as occurs at sites of wound healing. They can also be used to provide formation of the second of the second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         solar keratosis;
Example; Page 17; 28pp; English.

The sequence is that of a polypeptide present in fraction K of the venom of Agelenopsis aperta, it blocks calcium channels in cells of both mammals and invertebrates, partic. those affecting neuronal and muscle cells. It may be used in the treatment of angina, hypertension, cardiomyopathies, supraventricular arrhythmia, oesophogeal achalasia, premature labour, and Raynaud's disease. It may also be of use in the study of cell physiology and in the control of invertebrate pests. It may be produced synthetically.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.891; Variance 75.823; scale 0.552

PHILOS. TRANS. R. SOC. LOND., B, BIOL. SCI. 306:345-354(1984).
-!- FUNCTION: C1Q ASSOCIATES WITH THE PROENZYMES CIR AND C1S TO YIELD C1, THE FIRST COMPONENT OF THE PROENZYMES CIR AND C1S TO YIELD COLLAGEN-LIKE REGIONS OF C1Q INTERACT WITH THE CA(2+)-DEPENDENT C1R(2)C1S(2) PROENZYME COMPLEX. AND EFFICIENT ACTIVATION OF C1 TAKES PLACE ON INTERACTION OF THE GLOBULAR HEADS OF C1Q WITH THE FC REGIONS OF IGG ANTIDODY PRESENT IN IMMUNE COMPLEXES.
-!- SUBUNIT: C1 IS A CALCIUM-DEPENDENT TRIMOLECULAR COMPLEXES.
RAND SIN THE MODAR RATION OF 1:2:2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- SUBUNIT: CLO SUBCOMPONENT IS COMPOSED OF NINE SUBUNITS, SIX OF WHICH ARE DISULFIDE-LINKED DIMERS OF THE A & B CHAINS, AND THREE OF WHICH ARE DISULFIDE-LINKED DIMERS OF THE C CHAIN.
-!- SIMILARITY: CONTAINS A CLO DOMAIN.

EMBO J. 11:3921-3926(1992).

-! FUNCTION: PLATELET-DERIVED GROWTH FACTOR IS A POTENT MITOGEN FOR CELLS OF MESENCHMAL ORIGIN. BINDING OF THIS GROWTH FACTOR TO ITS AFFINITY RECEPPOR ELICITS A VARIETY OF CELLULAR RESPONSES. IT IS RELEASED BY PLATELETS UPON WOUNDING AND PLAYS AN IMPORTANT ROLE IN STIMULATING ADJACENT CELLS TO GROW AND THEREBY HEAL THE WOUND.
-! SUBBUILT: ANTIPARALLEL DISULFIDE-LINKED DIMER OF NONIDENTICAL (A AND B) CHAINS. HOMODIMER OF A AND B CHAINS ARE IMPLICATED IN TRANSFORMATION PROCESSES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A-A AND B-B, AS WELL AS A-B, DIMERS CAN BIND TO THE PDGF RECEPTOR

NT The first component of complement is a calcium-dependent complex of
the three subcomponents Clq, Clr, and Cls. Subcomponent Clq binds
to immunoglobulin complexes, with resulting serial activation of
Clr (enzyme), Cls (proenzyme), and the other eight components of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The Cig subcomponent is composed of nine subunits, six of which are disulfide-linked dimers of the A (see ClHUQA) and B chains, and three of which are disulfide-linked dimers of the C (see ClHUQC) chain. Equimolar amounts of the A, B, and C chains are found after reduction of the disulfide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            #domain signal sequence #status predicted #label SIG\

WT The active enzyme catalyzes the transfer of acyl groups from
lecithin to sterol to form sterol esters. Palmitoyl, oleoyl, and
linoleoyl residues can be transferred; a number of sterols,
including cholesterol, can act as acceptor. Apolipoprotein A-I is
a potent activator for this enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Meroni, G.; Malgaretti, N.; Magnaghi, P.; Taramelli, R.

Mean 29.922; Variance 51.029; scale 0.586 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- IN CONTRAST TO YEAST CYCLASE, S.POWBE CYCLASE IS NOT LIKELY TO B REGULARIED BY RAS PROTEINS.
-!- SIMILARITY: THE REPEATED LEUCINE-RICH (LRR) SEGMENT IS FOUND IN MANY PROTEINS. NUMBER IN THIS PROTEIN: 22.
-!- SIMILARITY: DELONGS TO CLASS-3 OF ADENXIYL CYCLASES.
-!- SIMILARITY: CONTAINS A PP2C-LIKE DOMAIN.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.467; Variance 48.238; scale 0.652

           complement components Gaa, Gaa and C5a; the inverse is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The albumin, vitamin D-binding protein and alpha-fetoprotein. The disulphide-stabilized loop structure is thought to be conserved. The type II motif, related to repeats found in epidermal growth factor precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats, (2, 3, 4 and 9) differ from the EGF-like motif in having a 4-6 residue insertion between cysteines 4 and 5 instead of the usual single residue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Ash hydroxylation. The 7th repeat contains the consensus O-glycosylation sequence, CXXXC.

Immediately following each repeat is a pentapeptide with the consensus sequence XD(IVY)(D/NBE. Fibulin binds to the cytopassing domain of the betal subunit of integrin adhesion receptors in a catton-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibronectin, collagen, laminin, and possibly also other proteins. Antibodies reactive with the protein have important diagnostic and therapeutic uses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Purified fibulin, DNA encoding it and antibodies reactive with it useful as diagnostic and therapeutic component.

Claim 10, Fig 5; 56pp; English.

The fibulin A, B and C forms are identical from their N-terminals to a divergence point at posn. 566 (terminal codon in fibulin A) at a which they are distinct, encoding polypeptides of 566, 601 and 683 residues resp. All three forms are rich in cysteine (11 %) and analysis with on and spacing of the Cys residues revealed two cys repeat lacking two Cys residues. The same motif is found in the repeat lacking two Cys residues. The same motif is found in complement components C3a, C4a and C5a; the inverse is found in albumin, vitamin D-binding protein and alpha-fetoprotein. The albumin, vitamin D-binding protein and alpha-fetoprotein. The calbumin, vitamin D-binding protein and alpha-fetoprotein. The factor precursor is a 6-Cys pattern repeated nine times, although the ninth repeat in the A form is incomplete. Four of the repeats of the A form is incomplete. Four of the usual single residue. Embodied within repeats 5, 6, 7 and 8 is the consensus sequence for Asp and Asn hydroxylation. The 7th repeat contains the consensus o-glycosylation sequence, CXCRPC.

Immediately following each repeat is a pentapeptide with the consensus sequence XD(I/V)(P/N)E. Fibulin binds to the cytoroplasmic domain of the betal subunit of integrin adhesion receptors in a cation-dependent, EDTA-reversible manner. It can be used to manipulate adhesion of cells to fibromectin, collagen, laminin, and possibly also other proteins. Antibodies reactive with the protein have importent diagnostic and therapeutic uses.

                                                                                                                                                                                                                                                                                                                              Pecombinant multimeric protein prodn. In bacteria - transfected with vector contg. new multi-cistronic expression unit, providing high level prodn. of pharmaceutical and cosmetic products Example 2.1.2; page 23-24; 42pp, German.
Plasmid pWW-2 contains the cDNA of the human PDGF-B gene, but with the 5'-translated region of the precursor being incomplete (see 080473, which encodes R6817). The BanHI/Noo! fragment of pWW-2 was used as the basis for mutagenesis to isolate the sequence coding for mature PDGF-B with a Met residue at the N-terminus. The mutagenised coding sequence was used in the construction of multicistronic expression units for recombinant expression of the PDGF-A/B dimer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Fig 4; 39pp; English.

Example 1 describes the subcloning and analysis of C-sis and V-sis genes encoding rPDGF B chain.

Clone U2-OS561 contains the c-sis gene encoding human PDGF B chain.

Exons 2-6 of this clone were subcloned and sequenced. They encode

New multicistronic expression units - for producing equimolar amis. of polypeptide(s) in mammalian cells as hosts

(Claim 11; Page 29; 109pp; German.

A PDGF-AB heterodimer is recombinantly produced using a bicistronic expression unit in which a sequence responsible for internal translation start is located between cistrons coding for the PDGF-B and PDGF-A chains. The preferred PDGF-B sequence for inclusion in the bliststronic construct is 058725 which codes for the precursor sequence 241 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New vectors expressing platelet-derived growth factor B epitope(s) - and contg. c-sis or v-sis genes portions; are used to promote wound healing and produce antibodies bisclosure; Fig 2: 49pp; English. Registed gescribes the amino acid sequence of recombinant platelet derived growth factor B c-sis (rPDGF B c-sis). It may be used to promote wound healing, or as an antigen to prepare antisera or sequence 241 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-JUN-1995 (first entry)
Recombinant platelet derived growth factor B c-sis, Recombinant platelet derived growth factor B c-sis, rPDGF B c-sis; Synthetic.

C vesicle and passaged a maximum of four times in cells in culture.

C vesicle and passaged a maximum of four times in cells in culture.

Viral DNA was prepd. from virons that accumulated in the cytoplasm of infected VERO cells (Kieff et al., J. Virol., 8, 125-132 (1971)).

C The Bamil SP junction fragments contg. the domain of the gene that specified ICP34.5 were cloned into a puC18 plasmid using HSV-1(F) sequences as probes in colony blot hybridisation. Further subclonings were done to facilitate sequencing of different regions of the gene. HSV may be rendered avizing HSV genome is useful for preparing a stable, non-transforming live viral vaccine which cells. The preparing a stable, non-transforming live viral vaccine which centured from a latent state.

Claim 23; page 42; 65pp; English.

The 4-1BB-L (ligand) protein is useful for exploring mechanisms of T-cell activation, as it is expressed on T lymphocytes. 4-1BB-L can be used as a tissue culture reagent for in vitro cultivation of primary T-cells during the derivation of clonal T-cell lines. It may also be used to stimulate proliferation of activated T-cells, used in therapeutic procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -cell; lymphocyte; activation; tissue culture; clone; cell lines;
